In this talk, we will show that the newly introduced \mathcal{F} -metric spaces, introduced by Jleli and Samet in [1], are metrizable. Also, we deduce that the notions of convergence, Cauchy sequence, completeness due to Jleli and Samet for \mathcal{F} -metric spaces are equivalent to that of usual metric spaces. Moreover, we show that the Banach contraction principle in the context of \mathcal{F} -metric spaces is a direct consequence of its standard metric counterpart.
